- Chinmay Rojatkar
- Deepali Mahajan
- Nikhil Aggarwal
- Bipasha zade

# Acknowledgement

A collection of small squares in various colors (pink, teal, orange) arranged in a scattered pattern in the top right corner of the slide.

We would express our gratitude towards the entire team of “*Almabetter Team*” for acknowledging us with such important domain and providing us an opportunity to work on real life problems through Capstone Project

A small cluster of squares in orange and teal colors located in the bottom left corner of the slide.

# Problem Statement

- Currently Rental bikes are introduced in many urban cities for the enhancement of mobility comfort. It is important to make the rental bike available and accessible to the public at the right time as it lessens the waiting time. Eventually, providing the city with a stable supply of rental bikes becomes a major concern. The crucial part is the prediction of bike count required at each hour for the stable supply of rental bikes.

# TABLE OF CONTENTS

01

## PROBLEM & SOLUTION

- ❖ Importing the necessary packages and libraries
- ❖ Mounting the drive for importing the data.
- ❖ Checking for missing, NaN values, Null values.

02

## OUR PROCESS

- ❖ Observing the datatypes
- ❖ Observing the correlation among independent variables.
- ❖ Exploring the data set.
- ❖ Exploring the categorical value numerical features from data

03

## TARGET

- ❖ Exploring different target variable.
- ❖ Splitting the data and training the data.
- ❖ Observing the results.

# Data Description :

## Dependent variables:

Rented Bike count - Count of bikes rented at each hour

## Independent variables:

Date : year-month-day

Hour - Hour of day

Temperature- Temperature in Celsius

Humidity - %

Windspeed - m/s

Visibility - 10 m

Dew point temperature - Celsius

Solar radiation - MJ/m

Rainfall - mm

Snowfall - cm

Seasons - Winter, Spring, Summer, Autumn

Holiday - Holiday/No holiday •

Functional Day -No Func, Func

8,760 Rows  $\times$  11 Columns

*In the data is no missing values*

## Rented Bike count and Temperature

## Rented Bike count and weekends

Rented bike count are  
negativity {-0.54} correlated  
with temperature

## Rented Bike count and Rain

Rented bike count are  
negativity  $\{-0.12\}$  correlated  
with rain

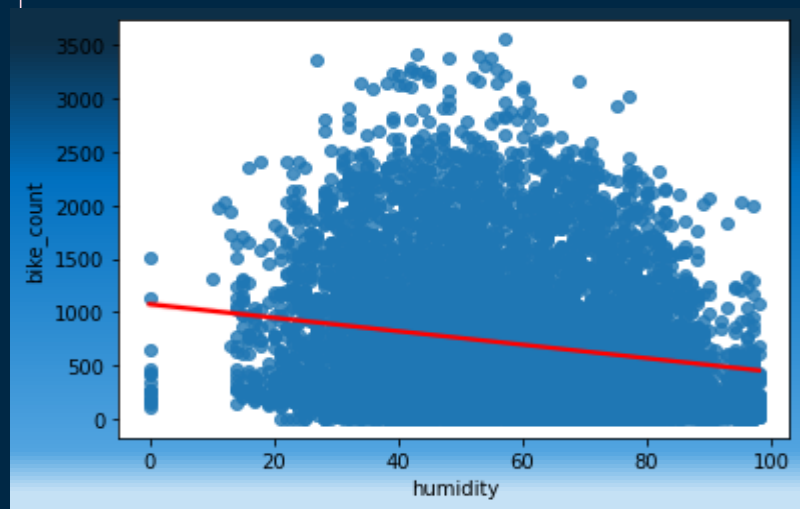

## Rented Bike count and visibility

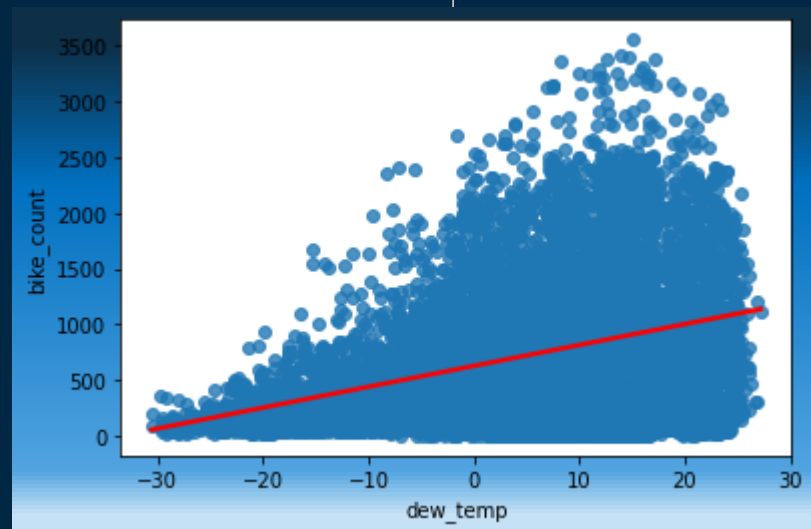

Rented bike count are positively{0.26} correlated with temperature

Plotting Regression plot of each columns  
of dataset v/s bike count columns

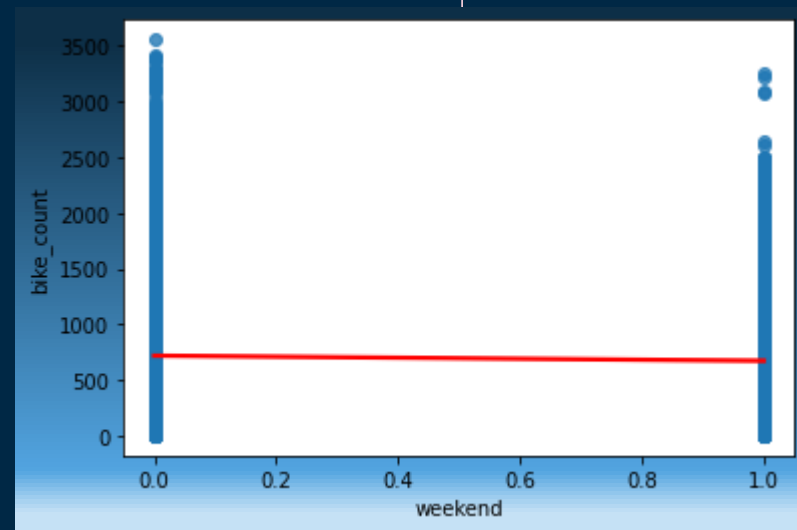

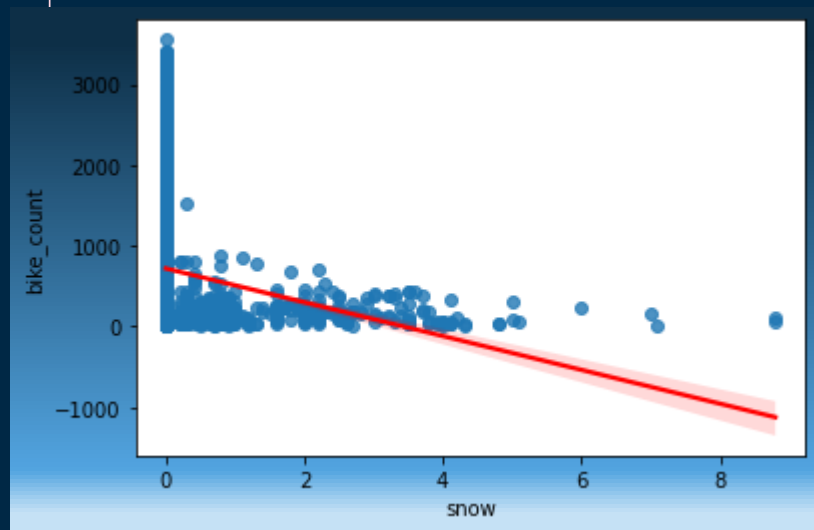

# CONCLUSION

- From above 'Regression Plots' we observe '**Temperature**', '**Wind speed**', '**Visibility**', '**Solar Radiation**' these features are positively related with our dependent variable.
- '**Rainfall**', '**Snowfall**', '**Humidity**' these features are negatively related with the dependent variable or Target variable.
- We can see the Left or Right skewness in data

01

# EDA

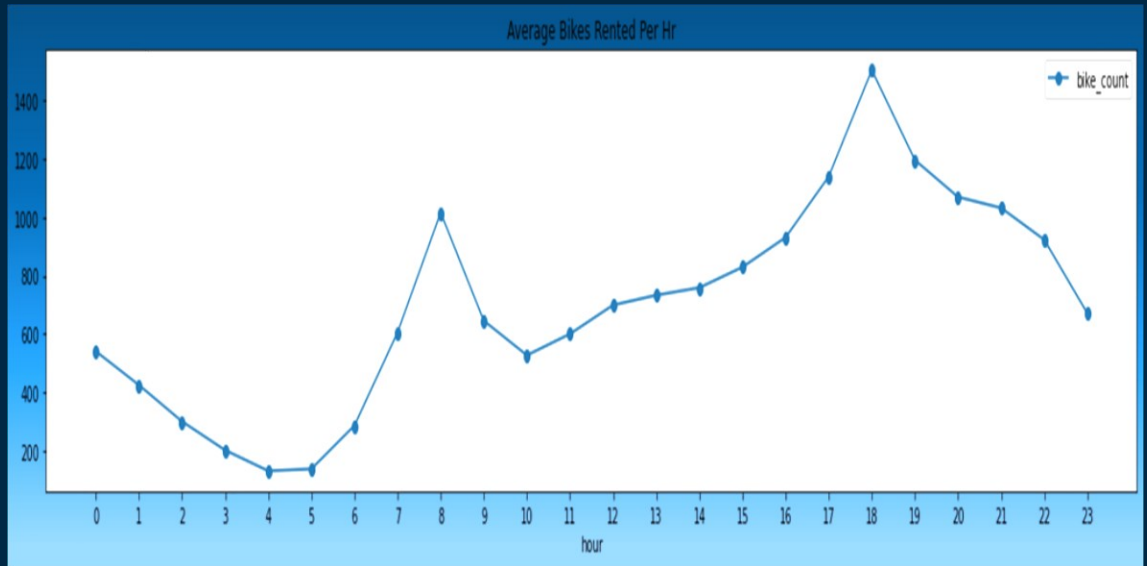

Distribution of  
rented bike count

Square root  
transformation of  
rented bike count

# AVERAGE BIKES RENTED PER HOUT :

# OUR PROCESS

# OUR PROCESS

- Less demand on winter seasons
- Slightly Higher demand during Non holidays
- Almost no demand on non functioning day
- (Summer season) and less demand in December , January and February(Winter Season).
- Weekday or weekend does not affect the rented bike count , we will try to see on the basis of hours how it affects.

# Model's Performed

Linear  
Regression

Actual value

Predicted value

— ACTUAL  
— PREDICTED

# RESULT

Model		MSE	RMSE	R2_score	Adjusted R2
Linear regression		143456.60	378.75	0.651	0.648

# Model's Performed

Lasso  
Regression

Actual value

Predicted value

# RESULT

Model		MSE	RMSE	R2_score	Adjusted R2
Linear regression		143543.00	378.87	0.650	0.648

# Model's Performed

## Ridge Regression

Actual value

Predicted value

# RESULT

Model		MSE	RMSE	R2_score	Adjusted R2
Linear regression		143543.03	378.65	0.651	0.648

# Model's Performed

## Decision Tree

Actual value

Predicted value

# RESULT

Model		MSE	RMSE	R2_score	Adjusted R2
Linear regression		98626.36	314.04	0.758	0.757

# Model's Performed

Random  
Forest

Actual value

Predicted value

# RESULT

Model		MSE	RMSE	R2_score	Adjusted R2
Random Forest		47887.70	218.83	0.8829	0.8820

# Model's Performed

Gradient  
Boosting

Actual value

Predicted value

# RESULT

Model	MSE	RMSE	R2_score	Adjusted R2
Gradient Boosting	69123.22	262.91	0.8310	0.8297

# Model's Performed

Xtreme Gradient  
Boosting

Actual value

Predicted value

# RESULT

Model	MSE	RMSE	R2_score	Adjusted R2
Xtreme Gradient Boosting	46458.60	215.54	0.8864	0.8855

# Model's Performed

light GBM

Actual value

Predicted value

# RESULT

Model		MSE	RMSE	R2_score	Adjusted R2
Light GBM		40840.23	202.08	0.9001	0.8994

# CONCLUSION

- ❑ No overfitting is seen, as we can see the models are performing well with the test data with good results.
- ❑ After performing the various models, the lightGBM and Xtreme Gradient Boosting found to be the best model that can be used for the Bike Sharing Demand Prediction since the performance metrics (mse,rmse) shows lower and (r2,adjusted\_r2) shows a higher value for the lightGBM and Xtreme Gradient Boosting models !
- ❑ In holiday or non-working days there is demands in rented bikes.
- ❑ People preferred more rented bikes in the morning than the evening.
- ❑ When the rainfall was less, people have booked more bikes except some few cases.
- ❑ The Temperature, Hour & Humidity are the most important features that positively drive the total rented bikes count.
- ❑ We can use either lightGBM or Xtreme Gradient Boosting model for the bike rental stations.

# THANKS
